Video and Image Processing Laboratory

Outline

- **Introduction of Low Power Deep Learning**
- **Applications That Need Low Power Deep Learning**
 - **Health care monitoring**
 - **Biomedical image analysis**
 - **Image Based Phenotyping**

Deep Learning “Requirements”

Reference: S. Bianco, et al., Benchmark Analysis of Representative Deep Neural Network Architectures, IEEE Access, 2018

Low Power Deep Learning

- **Current deep learning models are both power and memory intensive**
- **Need more analysis of computational cost (memory usage, inference time)**

After training...

Images Per Second vs. Accuracy

- Less computation hurts the performance

Reference: S. Bianco, et al., Benchmark Analysis of Representative Deep Neural Network Architectures, IEEE Access, 2018

Inference Speed on Embedded System

Nvidia Titan X with 3840 cores
(Power consumption is approximately 250w)

Nvidia Jetson TX1 board with 256 cores
(Power consumption is approximately 10w)

Reference: S. Bianco, et al., Benchmark Analysis of Representative Deep Neural Network Architectures, IEEE Access, 2018

Inference Speed on Non-GPU Device

- Frame per second on Raspberry Pi
 - Power consumption is approximately 6w

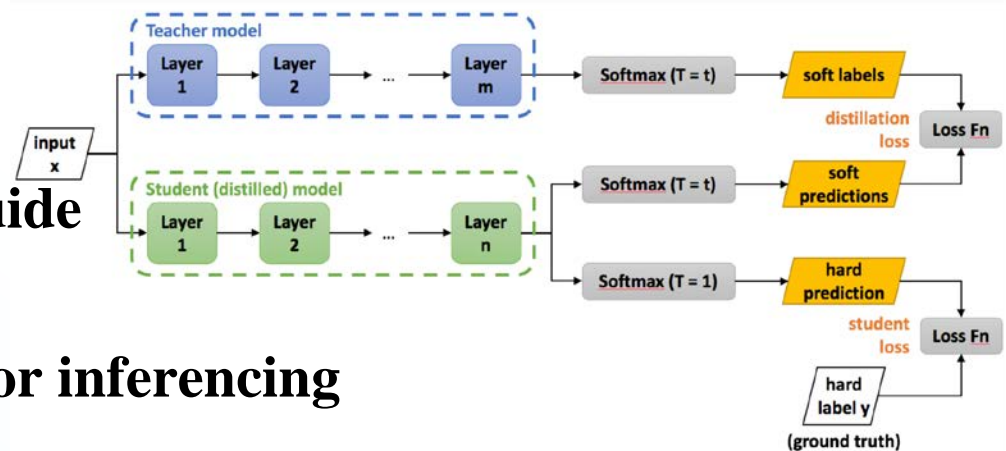

Reference: D. Velasco-Montero, et al., Performance analysis of real-time DNN inference on Raspberry Pi, SPIE Real-Time Image and Video Processing 2018

Methods for Reducing the Complexity of Deep Learning Models

- **Pruning**
 - Weight pruning: make the model weights sparse
 - Structure pruning: remove the filter directly
- **Knowledge Distillation**
 - Use teacher model to guide smaller student model
 - Student model is used for inferencing
- **Quantization**
 - Use less precision for model weights
- **Adversarial attacks and brittleness?**

Applications That Need Low Power Deep Learning

- Health care monitoring
- Biomedical image analysis
- Image Based Phenotyping

www.tadaproject.org

Health Care Monitoring

- In 2015, the world spent \$7.7 trillion on healthcare
- 6 out of 10 leading causes of death in US are related to diet (e.g., cancer, diabetes)
- Understanding the dietary patterns behind these causes is of great importance

Technology Assisted Dietary Assessment (TADA)

- **Traditional methods of tracking diet are inaccurate and labor-intensive**
 - **Consists of self-reporting and record keeping**
- **In recent years, researchers have leveraged mobile phones and the Internet to collect images of food**
- **These images are analyzed to extract nutritional information to monitor a person's diet**

User Studies

- **We have completed a total of more than 50 user studies**
 - **Free-living environment**
 - **More than 5000 participants**
 - **More than 400,000 images acquired**
- **Each food image captures a real eating scene consists of multiple food items**

TADA System Overview

TADA Image Analysis

Deep Learning Approach

Need for Low Power Computing

- **Our system is built on a cloud-based approach**
- **The relevant processing happens on a remote machine and real-time feedback to the user is difficult**
- **If a similarly performing system could be operated on commonly used mobile phones, the user could take more direct control of their diet and how it interacts with other factors**

Image Based Phenotyping

Definitions

- **Phenotype:**
“any measurable characteristic or trait of a plant, and a result of combination of genes, environmental influence, and their interactions” or

“quantitative description of the plant’s anatomical, ontogenetical, physiological and biochemical properties”
- **Phenotyping:**
“characterizing the performance of the plants for desired trait(s)”

Traits

- **Some traits measured when phenotyping:**
 - **Color**
 - **Height**
 - **Architecture (shape)**
 - **Canopy temperature**
 - **Canopy aperture**
 - **Water/nitrogen use efficiency**
 - **Number of leafs**
 - **Total leaf area**
 - **Grain yield**
 - **Fluorescence intensity**

Traditional and Modern Phenotyping

Traditional plant
phenotyping

Automated
phenotyping in the field

Counting Plants With Deep Learning

Dataset

06/21/2016

1,240 cigars \Rightarrow 1,240 images

- We extract one-row plots with our plot extraction tool

Plant Location Using Fully Convolutional Networks

- A Fully Convolutional Network (FCN) is any network that only contains convolutional layers
- This means the output of the FCN is another image

- The architecture of a FCN can be designed such that the output is of the same size as the input
- This is used in U-Net, a popular FCN architecture, to perform pixelwise segmentation

FCN Architecture

- It accepts images of any size (bigger than 256×256)

Cost Function For Plant Location

- The l_1 norm does not work well for localization tasks
- Let $X = \{x_1, \dots, x_{|\hat{Y}|}\}$ be the set of ground truth points, and let $Y = \{y_1, \dots, y_{|Y|}\}$ be the set of estimated locations
- A metric that measures the similarity between X and Y is the Hausdorff Distance:

$$d_H(X, Y) = \max\left\{\max_{x \in X} \min_{y \in Y} d(x, y), \max_{y \in Y} \min_{x \in X} d(x, y)\right\}$$

Plant Location Cost Function

- In fact, our cost metric is a little more complicated to deemphasize outliers and make it differentiable with respect to the output of the FCN, $p \in [0, 1]$:

$$d_{WH}(p, Y) = \frac{1}{\sum_{x \in \Omega} p_x} \sum_{x \in \Omega} p_x \min_{y \in Y} d(x, y) + \frac{1}{|Y|} \sum_{x \in \Omega} \min_{y \in Y} \frac{d(x, y)}{p_x^\alpha}$$

- The parameter α balances precision and recall
- This is similar to the Average Hausdorff Distance

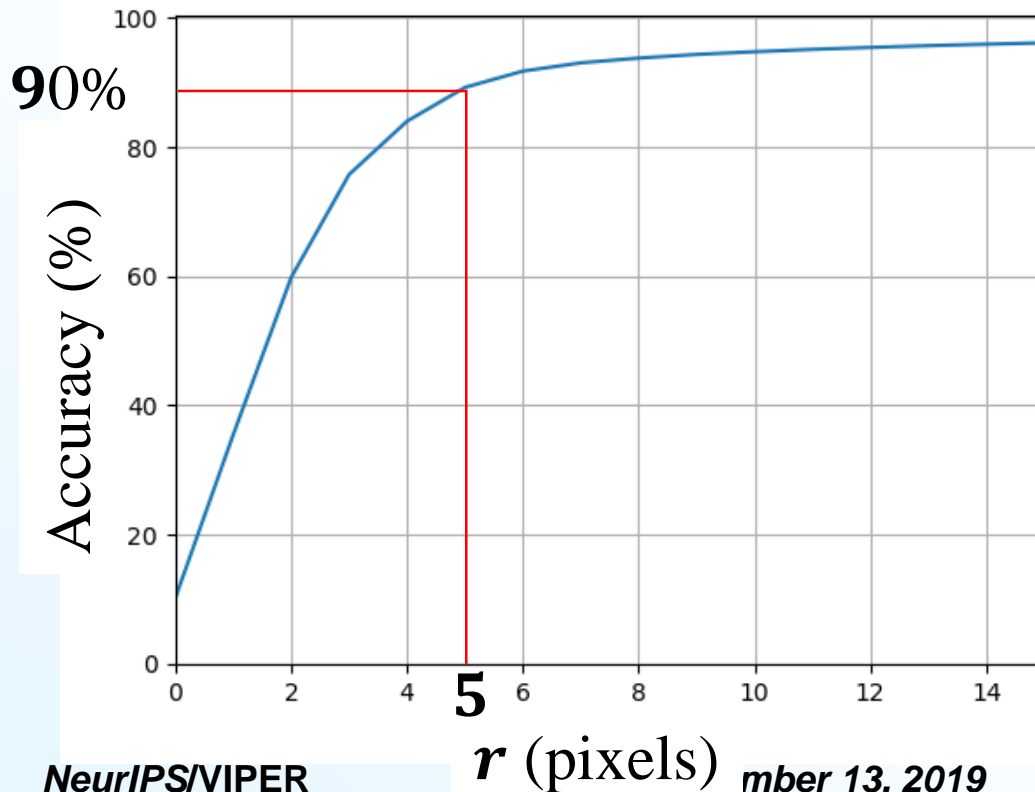

$$d_{AH}(X, Y) = \frac{1}{|X|} \sum_{x \in X} \min_{y \in Y} d(x, y) + \frac{1}{|Y|} \sum_{y \in Y} \min_{x \in X} d(x, y)$$

Results (Metrics)

- We report the following metrics in 256×256 images
 - Accuracy (% of estimations at $\leq r$ pixels to a plant)
 - Average Hausdorff Distance
 - Mean Average Percent Error

$$\text{MAPE} = 100 \frac{\overline{|\hat{x} - C|}}{C}$$

| Metric | |
|--------|--------|
| AHD | 8.8 px |
| MAPE | 4 % |

Regression Term

- **We modified the regression term in our cost function**

$$d_{WHD}(p, Y) = \frac{1}{\sum_{x \in \Omega} p_x} \sum_{x \in \Omega} p_x \min_{y \in Y} d(x, y) + \frac{1}{|Y|} \sum_{x \in \Omega} \min_{x \in \Omega} \frac{d(x, y)}{p_x^\alpha} + L_{reg}(|\hat{Y}| - |Y|)$$

- **We use Huber loss (also known as smooth L1)**

$$\mathcal{L}_{\text{reg}}(x) = \begin{cases} 0.5x^2, & \text{for } |x| < 1 \\ |x| - 0.5, & \text{for } |x| \geq 1 \end{cases}$$

- **Advantages.**

**Differentiable at the origin, and
does not over-penalize outliers**

- **We achieved an F-score: 93 % (at 5cm of error)**

Results: 2016 Data

Estimated plant centers (in red)

Results: 2017 Data

- **Trained our model using ground truth of the Inbred Calibration Panel by Neal Carpenter**
- **Mean Average Percent Error: 12%**
- **Mean Average Error: 2.6 plants per row**
- **F-score: 93 % (at 5cm error)**

Testing results on the
Hybrid Calibration
Panel (2017/06/09)

Need for Low Power Computing

- **End-users may not have the computational resource for fast inferencing**
- **Need for re-training**
- **Farmers need portable devices to get the results**
- **Edge-based computing is needed in this situation**
